

# BlueScout™ Turbine Control Technology

Bill Fetzer

VP Customer Service & Installations

BlueScout Technologies, Inc.

# Topics

- ✦ Introductions
- ✦ BlueScout Technologies
- ✦ Technical Presentation
- ✦ R&D Opportunities

# Vision

❖ BlueScout Technologies applies groundbreaking wind sensing to turbine control systems to increase the effectiveness and availability of wind turbines, providing increased energy production and decreased operating costs.

# The Problem

- ✦ Problem: Measuring wind behind the world's biggest propeller
- ✦ Effect
  - + Leads to poor turbine control response
  - + Correction of yaw errors is difficult
  - + Pitch control is reactive
  - + True power performance needs free stream wind data
- ✦ ***"Analysis of Traditional Yaw Measurement"***
- ✦ ***"Wind Measurements and Power"***

The Solution

# Measure Wind Before the Turbine

# BlueScout Experience

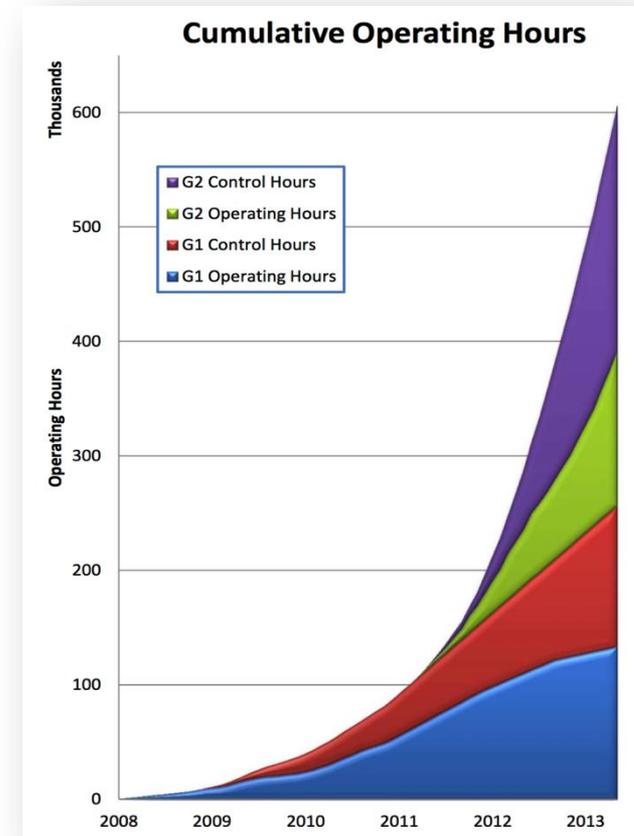

☀️ “Nothing ever becomes real 'til it is experienced.”

— John Keats

☀️ Over 30 installs done or planned

☀️ ~250,000 operating hours

☀️ Strong corporate focus on getting large scale deployments to accelerate operating hours

# GE 1.5sle Experience

- ✦ Installations - 10 deployments
  - + 66,984 hours
- ✦ Turbines controlled - 8
  - + 35,856 hours
- ✦ By early Q4
  - + 9 turbines will be under OCS control
- ✦ *"Controller Description GE 1.5SLE"*

# Turbine Control Example

- ✦ Test Period – May 2011 through July 2012
- ✦ Control logic switches at intervals between legacy and OCS control for comparisons
- ✦ Total control hours: 10,733
- ✦ Total hours analyzed: 6,562
- ✦ Data analyzed
  - + Turbine status = 2 (No faults)
  - + Load operation = 1
  - + OCS not in state = 0

# Power Gains

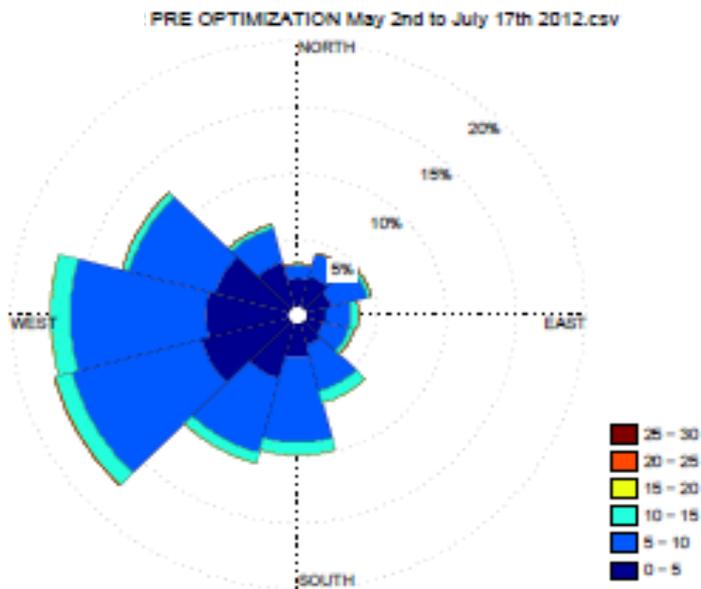

- ☀️ 4 Customer turbines under study
- ☀️ Control Method V1.0 power gain is 4%
  - + Optimization will add 2-4% to power increase
- ☀️ Power NF factor *decreases* 12%
  - +  $\text{Power NF} = \text{STD (Power)} / \text{MEAN (Power)}$

Time Weighted Average	
Power Increase	4.0%
Power Noise Factor – Legacy Control	0.65
Power Noise Factor – OCS Control	0.58

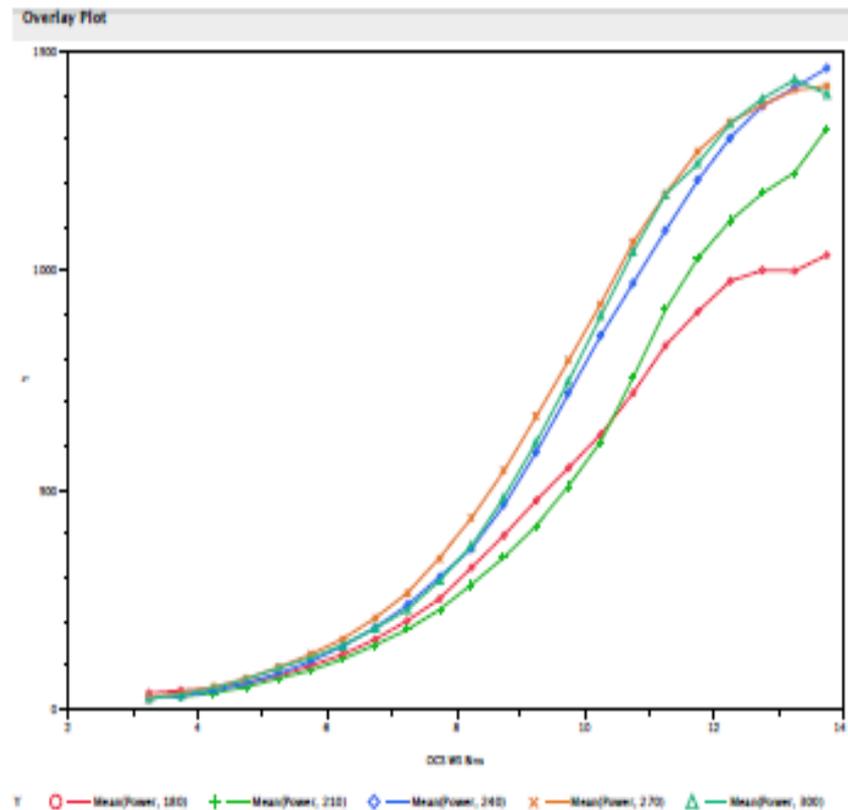

# Potential Benefits of Power “Noise” Reduction

- ✦ Generator putting out smoother power
  - + Converter is not working as hard
- ✦ Rotor speed may be more constant
  - + Blades pitching less and/or pitch management more effective
  - + Less wear

# Power Curves By Wind Direction

PRE\_OPTIMIZATION\_May\_2nd\_to\_July\_17th\_2012\_F By (OC3 W5 Btw) Overlay Plot by OC3 W5 Btw

# Future Research Opportunities

- ✦ Measuring stress load reduction related to better yaw control
- ✦ Acoustic noise reduction analysis
- ✦ Generator power noise reduction analysis
  - + NREL OCS data: Feed forward controls improve speed and torque controls in Region 3 (Rated Power)
  - + To be published in AIAA and IEEE papers in 6 months
- ✦ How does combined pitch control and yaw control affect power output in Region 2 (ramp up)?

# Questions – Follow-up?
